

QUICK START GUIDE

THIS GUIDE RELATES TO THE FOLLOWING STYLESHEETS:

PRODUCT: OS VECTORMAP® LOCAL

DATA FORMAT: GML

STYLESHEET FORMAT: GEOSERVER STYLED LAYER DESCRIPTORS (SLD)

The stylesheets have been designed to work with the data loaded into a database, for example PostGIS, with field names in full and in lowercase.

- 1 Either fork the stylesheets on [GitHub](#) or [download](#) them and navigate to the directory that matches your data format, stylesheet format and style preference.
- 2 Copy the folder 'ordnance_survey' into your GeoServer styles directory (a typical Windows file path is C:\Program Files (x86)\GeoServer 2.x.x\data_dir\styles, is using a workspace then use the \data_dir\styles path from there).
- 3 Load your OS VectorMap Local database into GeoServer.
- 4 Add the styles. If using the GUI then navigate to Styles > Add a new style > Browse and select to add each file in turn.
- 5 Publish these styles with the data. If using the GUI then navigate to Layers > Add a new resource and choose them from the relevant database to add each file in turn. Click on publish, configure settings and then choose the matching style before saving.
- 6 To create OS VectorMap Local in GeoServer you will need to create a Layer Group. If using the GUI then navigate to Layer Groups > Add new layer group > Add Layer and choose each layer in turn to create the following layer order:

Layers

[Add Layer...](#)

[Add Layer Group...](#)

Position	Layer	Default Style	Style	Remove
↓	OSGB:vmi_area		VML-backdrop-Area	
↑ ↓	OSGB:vmi_roadcline		VML-backdrop-RoadCLine	
↑ ↓	OSGB:vmi_line		VML-backdrop-Line	
↑ ↓	OSGB:vmi_point		VML-backdrop-VectorMapPoint	
↑	OSGB:vmi_text		VML-backdrop-Text	

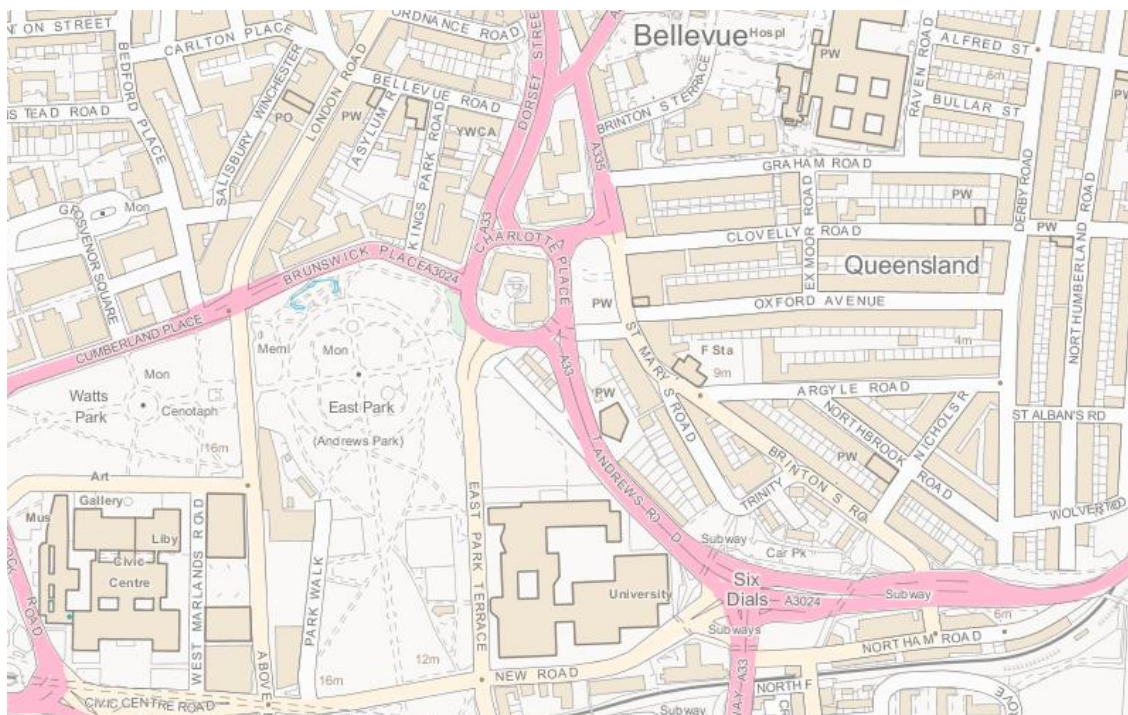

<< < 1 > >> Results 1 to 5 (out of 5 items)

The name of this Layer Group is the 'layer' your web map service (WMS) will need to call.

Although every feature is styled, for use as a general contextual map we have commented some of them out by default.

The scale denominators have been set to allow viewing between 1:1 000 and 1:15 000, although this will vary slightly by resolution.

Your map should look similar to this:

Compatibility notes

Although SLD is an open OGC standard, these SLDs do contain some extended code used by GeoServer, namely the ‘vendor option’ tags. Also, as aforementioned, the field names referenced in the SLDs are in full and in lowercase.
